TERMINOLOGY CONFUSION CLARIFICATION

The glossary of Prosthodontic terms defines CENTRIC OCCLUSION as the “occlusion of opposing teeth when the mandible is in centric relation. This may or may not coincide with maximum intercuspal position.”

The glossary definition is not the one most dentists have learned, and it may be confusing on the video you are viewing. Previous definitions of CENTRIC OCCLUSION have indicated that this position is the location where the patient chews, regardless of where it is in regard to centric relation.

In this video please interpret the phrase CENTRIC OCCLUSION, which is the older phrase that most dentists use, to mean the MAXIMAL INTERCUSPAL POSITION or MIP, which is the best fit of the teeth regardless of the condylar position.

It is my plan to eventually eliminate the phrase centric occlusion and replace it with the phrase maximal intercuspal position or MI.

Sorry for the confusion!

Thank you!

Gordon Christensen

PRACTICAL CLINICAL COURSES

PROCEDURE FOR RECEIVING
ACADEMY OF GENERAL DENTISTRY
AND STATE CREDIT
FOR DVDS

1. Complete the enclosed Post-Test.* For each **CE Video Purchased**, one test is included. If additional tests are needed, the following fees will apply: \$25 per test for 1 additional dentist; \$10 per test for each auxiliary (dental assistants, hygienists, lab technicians - no limit on auxiliary tests). Fees can be paid either by check or credit card when tests are submitted to Practical Clinical Courses.
2. Complete the demographic information located at the end of the test.
Type of Credit:
 - a. If the applicant selects "State," PCC will send a certificate of verification to the applicant. The applicant must then submit this certificate to his/her state board to obtain credit.
 - b. If the applicant selects "AGD," PCC will submit credit information to the Academy of General Dentistry and confirmation to the applicant that it has been submitted. (The applicant may check their AGD transcript for verification – please allow 30 days.)
 - c. If the applicant selects "Both," PCC will complete a. & b. above.
3. Return the **Post-Test portion** via mail, fax, or email. Our contact information is as follows:

Practical Clinical Courses
3707 N Canyon Road
Suite 3D
Provo, UT 84604
Fax: (801) 226-8637
[**info@pccdental.com**](mailto:info@pccdental.com)

4. Practical Clinical Courses will correct the Post-Test. **Passing scores are 70% or higher.**

***TO OBTAIN CE CREDIT ONLINE:** Login or create an account on www.pccdental.com and select "My CE Tests" from the left-side menu. Click on the video title to take the test online. **RESULTS ARE IMMEDIATE.** Missing the test? Contact us at 800-223-6569 during our business hours of 7:00 a.m. – 5:00 p.m. MST to add it to your account.

The techniques and procedures on this videotape are intended to be suggestions only. Any licensed practitioner viewing this presentation must make his or her own professional decisions about specific treatment for patients. PCC is not responsible for any damages or other liabilities (including attorney's fees) resulting, or claimed to result in whole or in part, from actual or alleged problems arising out of the use of this presentation.

Occlusal Splints (Bite Guards) for Temporomandibular Disorders (TMD) or Bruxism

1. Reasons for Occlusal Splints: The purpose of splint therapy is to allow your lower and upper jaw to come together without tooth contact, thereby reducing muscle pain and tooth wear. Many situations cause the malfunction of your lower jaw. Examples are accidents, surgery, developmental defects, peculiar oral habits, many fillings placed over numerous years, naturally occurring malocclusion (poor bite), orthodontics, psychological stress, bruxing (abnormal, excessive tooth contact), and other conditions.

2. What Does an Occlusal Splint Accomplish? This treatment has been used for many years to keep the teeth from contacting during chewing and to allow the lower jaw to return to a comfortable hinge position without interference and guidance from the teeth. When the splint has been worn for a few days the jaw functions freely. Occlusal splints assist in establishing normal jaw function.

3. Types of Splints:

- **Full Arch:** Some splints fit on your upper or lower jaw and cover all of the teeth on that arch.
- **NTI-TSS:** These usually small splints fit only in the front of your mouth and are used part-time.

4. When Are Splints Worn?

- **If you have a Temporomandibular Disorder – (TMD):** You will probably receive a full-arch splint. You should wear the splint at all times including while eating, unless directed otherwise. If you remove the splint to eat, your treatment will not be as effective. Many fillings placed in your mouth over the years or other conditions have caused your teeth to meet in a position your jaws cannot tolerate. The splint eliminates tooth-to-tooth contact. Usually, your symptoms will gradually disappear while you are wearing the splint; and your natural teeth, bridges, and/or fillings will be adjusted to the new bite by us. This procedure is called occlusal equilibration. After equilibration, you may be asked to wear your splint only at night. After a period of time, you will not wear the splint at all. The described treatment usually requires a few weeks to several months.
- **If You Grind or Clench Your Teeth Excessively:** You should wear your splint at night when you cannot control your jaw movements or during times of psychological stress. During the daytime, make sure your splint is placed in water to avoid warping.

5. Cleaning the Splint and Teeth: Food accumulates around and under splints. At least one time each day, brush and floss your teeth very thoroughly. Brush and rinse the inside and outside of the splint, and then return it to your mouth. Accelerated dental decay will progress in the teeth under the splint if you are not careful about cleanliness of your mouth and splint. If you have a high dental decay potential, fluoride-containing rinses or gels may be suggested to be placed into your splint once per day.

6. When the Splint Is Out of the Mouth: Your teeth may not meet in harmony. This situation is to be expected because of muscle and jaw relaxation while you were wearing the splint. Occlusal equilibration may be requested to eliminate this improper meeting of the teeth (malocclusion). If the splint is out of your mouth, place it in a container of water to prevent it from warping. You may desire to soak it occasionally in a commercially available denture cleanser. As an alternative, you may soak it in a solution made by adding a few drops of Clorox to a cup of water.

I have read and understand the above information.

CEO, CR Foundation
Practicing Prosthodontist, Provo, Utah

GOALS & OBJECTIVES

At the completion of this video presentation, participants should be able to accomplish the following:

1. List four types of occlusal splints.
2. Describe the difference between preventive and therapeutic splints.
3. Describe how an occlusal splint reduces or eliminates the occlusal tooth wear of bruxism.
4. Discuss the percentage of patients having bruxism or clenching.
5. List five treatments, other than occlusal splints or occlusal equilibration, for occlusal diseases or conditions.
6. List six situations for which occlusal splints are useful.
7. Discuss how long is required for a patient to become accustomed to an occlusal splint.
8. Describe the characteristics of bruxism.
9. Describe the characteristics of clenching.
10. Discuss the approximate percentage of TMD patients who can be successfully treated with occlusal splints.
11. Discuss the reasons for use of a splint before an occlusal rehabilitation.
12. Discuss how occlusal splints may be used after an occlusal rehabilitation.
13. Discuss how occlusal splints may be used for orthodontic reasons.
14. Discuss how occlusal splints may be used after periodontal treatment.
15. Describe the characteristics of a full-occlusal resin splint.
16. Describe the characteristics of an anterior repositioning splint.
17. Describe the characteristics of a partial occlusal coverage splint.
18. Describe the characteristics of a soft occlusal splint.
19. Discuss making occlusal splints in the laboratory vs. in the clinic.
20. List the steps in making and seating a laboratory-made or clinically-made splint.

OVERVIEW

V3104 Occlusal Splints – Predictable Therapy for Frequent Use

Occlusal splints have been used for over 100 years for both preventive and therapeutic purposes. However, it has been estimated that far more splints are needed than are placed. It has been estimated that about one-third of the world population has bruxism or clenching, and these patients should have occlusal splints. When combined with temporomandibular dysfunction patients, pre- and post-restorative patients, and those needing splints for orthodontic or periodontal reasons, as high as 40% of patients could need occlusal splints. There are several types of occlusal splints used commonly. Some of the types are:

1. Full occlusal coverage hard resin splints
2. Anterior repositioning splints
3. Partial occlusal coverage splints
4. Soft splints, made in the laboratory
5. Thermoplastic soft resin splints made in the clinic
6. Splints that are hard on the outside and soft on the inside

Preventive occlusal splints are most commonly used to reduce or eliminate tooth wear caused by bruxing or clenching. Therapeutic splints are most commonly used to treat temporomandibular joint dysfunction. Therapeutic and preventive splints have similar characteristics including: canine rise, incisal guidance, at least one centric stop on every opposing tooth, and a maxillo-mandibular centric relation occlusion (CRO) relationship. Occasionally, for various reasons including bruxing, splints are made with both a long-centric and a wide centric occlusal relationship. Splints used for orthodontic treatment have various different characteristics.

Fabrication of occlusal splints may be accomplished either in a dental laboratory or in the clinical office. Fabrication in a laboratory saves clinical time, but is accompanied with a laboratory bill and lack of clinical observation. Fabrication clinically requires clinical time, but eliminates a laboratory bill. Either method of fabrication can be acceptable, and selection of either laboratory or clinical fabrication is up to the individual practitioner.

Although there are many forms of splints, a typical centric-relation-occlusion splint has the following characteristics:

1. occludes with the opposing arch in centric-relation-occlusion
2. minimal thickness on the occlusal surface is 1.5 mm or more in the posterior area
3. canine rise and incisal guidance are present
4. knife-edge adaptation of resin at the juncture of the splint and the palate
5. only a thin veneer of resin is present on the facial surfaces of the molars and premolars
6. resin is not present on the facial surfaces of the anterior teeth
7. resin is thin over the incisive foramen area
8. smooth and well-polished

This presentation demonstrates all of the steps in fabrication of a clinically-made splint, shows several types of splints, and suggests uses for these splints.

POST-TEST

V3104 Occlusal Splints - Predictable Therapy for Frequent Use

1. Occlusal splints may be used for (select one):
 - a. preventive reasons.
 - b. therapeutic reasons.
 - c. preventive or therapeutic reasons.
 - d. substitutions for full crowns.

2. Bruxing patients should have an occlusal splint with these characteristics:
 - a. centric-relation-occlusion.
 - b. reverse incisal guidance.
 - c. reverse canine rise.
 - d. long-centric and wide centric.

3. Clenching patients should have an occlusal splint with these characteristics:
 - a. centric-relation-occlusion.
 - b. reverse incisal guidance.
 - c. reverse canine rise.
 - d. long-centric and wide centric.

4. The most commonly made type of splint for TMD should have these characteristics:
 - a. centric-relation-occlusion.
 - b. reverse incisal guidance.
 - c. reverse canine rise.
 - d. long-centric and wide centric.

5. Anterior repositioning splints should be worn:
 - a. mornings only.
 - b. all of the time.
 - c. afternoons only.
 - d. during sleeping and stressed times.

6. Soft splints were recommended for:
 - a. interim or temporary use.
 - b. full-time use.
 - c. nights only.
 - d. days only.

7. Pre-rehabilitation splints should be worn:
 - a. at the anticipated vertical dimension of occlusion.
 - b. all of the time.
 - c. for about 6 weeks.
 - d. all of the above.

POST-TEST (CONT'D)

V3104 Occlusal Splints - Predictable Therapy for Frequent Use

- 8. Post-rehabilitation splints should be worn:
 - a. only when stressed.
 - b. all of the time.
 - c. when sleeping or stressed times.
 - d. with fluoride in them each night.

- 9. A significant potential negative influence observed with partial occlusal coverage splints is:
 - a. extrusion of teeth not contacting the splint.
 - b. breakage of the splint.
 - c. protrusion of the anterior teeth.
 - d. retrusion of the anterior teeth.

- 10. A SVED appliance is:
 - a. a full occlusal coverage splint.
 - b. a partial occlusal coverage splint.
 - c. an anterior repositioning device.
 - d. a soft splint.
